

Machine Safety Analysis and Remediation

- Will you be unsuccessful in passing an OSHA safety inspection of your machines?
- Have you been cited for alleged violations of machine safety within your workplace?
- Are your employees susceptible to injury due to the lack of machine safety?
- Have you experienced a machine safety related incident in your plant?

If you answered no to all of these questions you do not require our assistance, but if you answer yes to any please contact us. Our staff knows what is required to meet Osha regulations and what it will take to update your existing machinery to current standards!

Safety has become a significant issue and measures must be taken to prevent access to dangerous areas of machinery, or stop movement before any part of a person can enter a danger zone.

Loman will perform “Risk Assessment” (identify hazards), evaluate control system integrity, recommend and perform necessary upgrades including, but not limited to:

- Redesign of existing control systems and implementation of improvements
- Barriers such as fixed guarding, removable guards with interlocking and light curtains
- Safety floor mats
- 2-Hand control, safety relays, etc...

It's better to pay a little now for prevention
versus a lot later.

Allow Loman to be of assistance before your next machine safety violation, or worse, injury, fines and lawsuit!

Call Loman Control Systems today to find out how we can help design a safer and more efficient production solution for you!
